Triage That Tells Attack From Noise

Raises the burst that looks like an intrusion, dampens the benign one — advisory, never blocking.

ADVISORY

— THE PROBLEM

The SOC drowns in alerts, not attacks

- Most scary-looking events are a service account doing its job.
- **The hard part is separation**
  surfacing the one burst that matters.
- Auto-blocking on a false positive is its own outage.

`You don't need more alerts. You need a defensible gap between attack and noise.`

— THE SOLUTION

Score it, name it, prioritize it

- **It scores**
  auth failures, source reputation, and endpoint criticality become a risk score.
- **It hypothesizes**
  brute-force or compromised-endpoint — a named pattern, not just a number.
- **It advises**
  an investigation priority for an analyst; no traffic is ever blocked.

— HOW IT WORKS

Events in, a scored hypothesis out

0 **Security event**
auth fails · reputation · criticality

1 **Feature**
anomaly · lateral · FP dampener

2 **Hypothesis**
brute-force · compromised

3 **Result**
priority · investigation

A feature layer dampens false positives before the hypothesis layer names the pattern.

— THE PROOF

A wide, defensible gap

0.836

attack-like stream — advisory raised

vs 0.18 benign

Dampened

benign service account recognized

120

deterministic ticks, two streams

— THE CEILING

Advisory, not active defense

ADVISORY Recommends an investigation priority; never blocks traffic or locks an account.

Separation A wide score gap is what lets an analyst trust the call.

Auditable Every advisory carries its hypothesis and score.

— GOING LIVE

Sit on the stream you already run

- **Swap the input edge**
  the mock events become a live Kafka consumer.
- **Keep the contract**
  same typed signals, same advisory ceiling.
- **Keep the analyst**
  a human still owns every defensive action.

“

Triage isn't about catching everything loud — it's about making the one alert that matters impossible to miss.

The case for Demo 06

Surface the signal. Skip the noise.

Scored hypotheses and investigation advisories — no auto-blocking.
