

See the Failure Before It Bills You

A ten-pump fleet monitor that flags the one asset that's actually degrading.

ADVISORY

— THE PROBLEM

You're either over-maintaining or getting surprised

- Fixed-calendar maintenance burns budget on machines that are perfectly fine.
- Run-to-failure trades that budget for unplanned downtime — the expensive kind.
- Alarm-on-everything monitoring just moves the noise around.

The win isn't more alerts. It's the right alert on the right asset.

Per-asset health, one targeted advisory

- **It estimates**
vibration and bearing-temp trends become a degradation score and a remaining-useful-life projection.
- **It targets**
only the degrading pump earns an advisory; healthy pumps stay quiet.
- **It explains**
every advisory carries an audit reason.

Telemetry in, targeted advisory out

Health estimation drives a priority-scored maintenance window.

— THE PROOF

It separates the sick from the healthy

RUL 40

degrading pump-03 — advisory raised
vs RUL 950 healthy

0

advisories for the healthy pump, same window

1000

deterministic ticks across 10 pumps

An offline pump (pump-07 after t8) raises a device-offline advisory – not silence.

Advisory by design

ADVISORY It recommends; a planner decides. No autonomous write to any asset.

Targeted Flags the degrading asset, not the whole fleet.

Auditable Every recommendation carries its reason.

Plug into the fleet you already have

- **Swap the input edge**
the mock telemetry becomes a live MQTT / Sparkplug feed.
- **Keep the contract**
same typed signals, same advisory ceiling.
- **Keep the human**
the planner still owns the schedule.

“

Predictive maintenance pays off when it's quiet about the healthy machines and precise about the failing one.

The case for Demo 02

JNEOPALLIUM · DEMO 02
